Decision Tree

Features

We stop building the tree when we hit fewer than \mathbf{X} number of samples in the node or when the difference in the node's entropy and the newly calculated entropy is less than \mathbf{T} .

Results

Lowest error rate = 6.84%for (X, T) = (25, 0.01) and (25, 0.001)

X / T (see above)	0.1	0.01	0.001	0.0001
1	0.0983	0.0716	0.0716	0.0716
3	0.0983	0.0736	0.0716	0.0716
5	0.0983	0.0716	0.0749	0.0710
10	0.0983	0.0716	0.0749	0.0736
25	0.1003	0.0684	0.0684	0.0716
50	0.1003	0.0736	0.0749	0.0749
100	0.1003	0.0879	0.0879	0.0879

Random Forest

Features

Based on our code for decision trees. We updated our code so that each node stores the probability that it is spam or ham (based on the sample labels at each node), instead of just storing a boolean.

Based on Breiman's algorithm. Includes randomization of a subset of **S** samples for each tree. Each tree also randomly selects a random subset of **F** features from which to test questions. We tested results on varying **N** number of trees.

Same stopping criteria as above based on hyperparameters **X** and **T**.

Results

lowest error rate = 5.79% in the following values of hyperparameters.

The full set of results is in the table at the end of the report.

error	Т	х	num_trees	sample_subset	feat_subset
0.0579	0.001	5	25	2000	45

Adaboost

Features

We used the decision tree from part 1 and removed the stopping criteria T and X for entropy change and number of samples in the node. We added a depth restriction so trees stop growing after depth D.

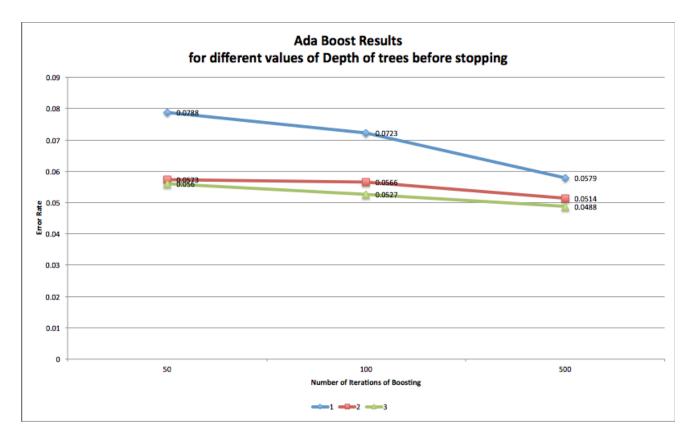

We tuned hyperparameters D and the number of iterations.

Results

lowest error rate 4.88% with depth = 3 and 500 iterations

Error	Depth	Iterations
0.0788	1	50
0.0573	2	50
0.056	3	50

0.0723	1	100
0.0566	2	100
0.0527	3	100
0.0579	1	500
0.0514	2	500
0.0488	3	500
